

ABSTRACT

A travel system and a method are applied to a business
5 entity. The business entity associates with at least a
business partner which can communicate with the travel
system. The travel system includes an employee's basic data
database for storing employee's basic data and employee's
identification codes and a travel data database for storing
10 the travel application data. Every employee of the business
entity has an individual employee's identification code
with respect to an employee's basic data. Prior to the
travel, the employee needs to register a travel application
data respective to the employee's identification code. The
15 method includes steps of: 1) the travel system forming a
travel services data by combining the employee's basic data
and the travel application data; 2) the travel system
sending the travel services data to said business partner;
and 3) the business partner performing travel services
20 according to the travel services data.
